

Raingentic

The business control plane for agent commerce

A2A negotiation. AP2 authorization. Monad settlement.
Rain-controlled procurement.

raingentic.saibolla.com

Platform Connect anything Payment rails

One platform for agent buying and selling

Connect your business. Let agents transact.

Connect the APIs, products, payment providers, and policies your company already uses. Raingentic gives agents a governed way to discover, negotiate, buy, sell, and settle.

Buying

 **Buying agent**
Waiting for instructions

Find a compliant data
10,000 requests. Ker
\$300 and ask before
vendor.

Agents can reason. Businesses still cannot safely let them transact.

Products

APIs, services, subscriptions, and physical goods already live across disconnected systems.

Authority

Budgets, approval thresholds, seller restrictions, and payment permissions are not native to agents.

Execution

Stablecoin rails and card rails solve different purchases, with no shared control or receipt layer.

The missing product is not another wallet. It is governed commercial authority.

One control plane governs both sides of commerce.

BUY

Describe a need

Discover sellers
Negotiate through A2A
Check policy
Approve and pay
Verify delivery

SELL

Connect what exists

Import APIs or stores
Price each product
Set negotiation limits
Publish for agents
Receive the right payment

Raingentic does not replace checkout, inventory, billing, or fulfillment.

It makes them usable by agents.

AI proposes. Deterministic code authorizes.

A live OpenAPI document becomes 18 agent-buyable products.

Selling > Products

Load demo data

Connect your catalog

Bring the products your company already sells. Raingentic normalizes them into one catalog for humans and purchasing agents.

Catalog source

Choose the interface your existing system provides.

OpenAPI document

Import every path, operation, schema, and endpoint.

Commerce platform

Connect any store through an app, plugin, or API.

Billing platform

Import products, plans, prices, and subscriptions.

Custom API or database

Connect a REST endpoint or your internal catalog service.

Website catalog

Extract public products and review them before publishing.

OpenAPI document

Provide an OpenAPI URL or upload the document. Each operation becomes independently configurable.

OpenAPI document

https://preflight.saibolla.com/openapi.json

Import endpoints

Load complete demo instead

Credentials are requested through the connector and remain server-side. The original system stays the source of truth for inventory, fulfillment, taxes, and checkout.

18 operations found

Review the imported endpoints, their evidence status, and pricing before publishing. Runtime responses preserve live, cached, derived, or simulated status.

Connected

Method	Endpoint	Product	Evidence	Published price
GET	/api/preflight/weather/metars	METAR observations	live	\$ 0.01
GET	/api/preflight/weather/tafs	TAF forecasts	live	\$ 0.015
GET	/api/preflight/weather/pireps	Pilot reports	live	\$ 0.02

18
independently priced
operations

13 live
3 derived
2 simulated

Price floors, discounts, payment rails, and negotiation rules publish with the catalog.

05

The agent stops exactly where company authority ends.

Recent decisions

\$1,450

negotiated order

\$500

automatic authority limit

No payment continues until a human approves the exact seller, product, and amount.

06

Negotiation and payment authority are different protocols.

Agreement is not permission to spend.

Monad settles native machine commerce.

x402

The protected API returns a result only after test USDC settlement is verified.

Buyer and seller wallets
Monad Testnet USDC
x402 facilitator
AP2 authorization binding
Settlement response verification

Optional high-value path

A deployed Solidity escrow records buyer, merchant, amount, deposit, expiry, and commercial terms.

Rain reaches the merchants that do not speak agent-native payments.

Readiness score

18/18

deployed PreFlight operations return HTTP 200

No production banking, mainnet funds, or unrelated external A2A counterparty is claimed.

One build directly addresses all three tracks.

Best use of Rain

AP2-scoped cards, real policy declines, approved settlement, transaction retrieval, and treasury routes.

General track

Agents discover, negotiate, stop for approval, move test or sandbox money, and verify delivery.

Monad + Rain

Monad handles machine settlement. Rain handles traditional procurement. One policy layer chooses both.

Raingentic turns a company's existing commerce into governed agent infrastructure.
